## SULPHUR MINES IN STATE OF WYOMING

Geological Survey Looks Into Interesting Deposits of the Cedar Mountains.

SULPHUR SMELTER NOW BEING WORKED

Mineral Is Deposited From the Numerous Springs of That Section.

The hot sulphur springs and travertine deposits in the vicinity of Cody, Wyo., have been known for many years and were briefly described by George Eldridge of the United States Geological survey, in a report on a geological reconnaissance in northwestern Wyo-ining, published by the survey in 1894. A more recent account of the deposits, also very brief, is given by C. A. Fisher in the survey's professional paper No. 53, on the geology and water resources of the Bighorn Basin. The first official report on the workable sulphur deposits of the region has however just ap-peared in the form of an advance chap-rer from bulletin No. 340, "Contributions to Economic Geology, 1997," the basis of the report being an invastigation made during the field season of 1997 by E. G. Woodruff, one of the geologists of the Federal survey. cal reconnaissance in northwestern Wyo

Federal survey.

The deposits described by Mr. Wood-ruff are located about three miles west of Cody, along the buse of Cedar moun-tain, on the south side of Shoshone river. tain, on the south side of Shoshone river. Though geologic conditions are favorable for the formation of sulphur both north and south of the river, the deposits considered workable at the present time are confined to a belt two miles long and this than one-fourth mile wide, extending southeastward from the hot springs along the foot of the mountains to Sulphur creek. All of the mines now producing sulphur are included in a small area a few acres in extent, located near the north end of the mineralized zone south of Shoshone river. This area is shown on the map that accompanies the report.

shown on the map that accompanies the report.

The sulphur occurs native in small yellow crystals and in gray streaks in the rocks, and is found in irregular beds in flinestone and travertine associated with fine crystailine aggregates, filling cavities two to eight inches in diameter, and also disseminated through the limestone, where it has been deposited by sulphurbearing gases permeating small crevices in the rock. The cavities mentioned seem to be portions of subterranean channels through which the hot sulphur-bearing waters flowed and en the walls of which the sulphur was gradually deposited until the chamber was partly or entirely filled. No regular arrangement of savities has been discovered, though they seem to be in groups at places where the waters found free passage. In the areas between the groups of cavities only a small amount of sulphur is found, but in the enriched pockets the sulphur reaches 30 to 50 per cent of the rock and becomes commercially important.

That the sulphur was deposited by hot springs is indicated by the presence of sulphur in the waters now issuing from the hot springs in Shoshone canyon. The waters of these springs, which issue at a temperature of 98 degrees Fahrenheit, contain large quantities of hydrogen sulphide and carbon dioxide, and hold in solution compounds of many other minerals. The water is clear and emilian oder of sulphur so strong that it may be detected in the canyon two miles downstream from the springs.

The sulphur is mined by means of open pits located in promising places. Small holes are put down and the rock is blasted with powder. The rock is then soried by hand and all ore estimated to contain more than 30 per cent of sulphur (the yearly avgrage of the ore smelted is 55 per cent) is taken by wagen or train to the smelter, near the mouth of the canyon. The sulphur refining and milling plant was built in 1906, and during the first year of its operation produced 550 tons of sulphur from 2532 tous of ore. report.

The sulphur occurs native in small yel-

the smelter, near the mouth of the canyon. The sulphur refining and milling
plant was built in 1906, and during the
first year of its operation produced \$50
lens of sulphur from 2832 tons of ore. I
Of this amount 350 tons were sent to
Omaha, Neb, the chief distributing point,
and the remainder was used in compounding sheep-dipping preparations in
Wyoming and adjacent States. The market price is \$50 a ton at Cody. The process used at the plant is not considered
very efficient, as only about two-thirds
of the sulphur which the rock contains is
meited out; the remainder, being contained in the gangue, is thrown on the
refuse dump.

Mr. Woodruff's paper, which may be

lained in the gangue, is thrown on the refuse dump.

Mr. Woodruff's paper, which may be obtained by applying to the director of the Geological survey at Washington, D. Ch. describes the surface features of the region, the geological relations of the deposits, and the nature, occurrence, and menests of the ores. It includes also a list of the survey publications relating to sulphur and pyrite.

J. OBERNDORFER, STOCK BROKER, 161 S. Main. Tel. Bett 792

#### Something a Man Never Regrets

A man never regrets the money he has saved—in fact, it is one of the bright st times of his life—one which he can ever recall with pride and satisfaction. But do not ne disheartened if you have not saved money in the past—rise to the oc-casion and take advantage of the opportunity now afforded to in-crease your surplus funds, by opening an account with the Com-mercial National Bank.

cent Interest Paid on Sav-Money deposited the first 5 days of draws interest from the first of the month.

#### MINES AND STOCKS.

This is a good time to buy while prices are low.

We advise the purchase of BING-HAM STOCKS. Bingham Central Standard is a good buy at double present price, now 50c. Bingham Butte Consolidated at 20c is one of the best buys.

HOW THE GUGGENHEIM

COMPANY NOW STANDS

Financial Statement of Explora-

tion Company Shows Very

Gratifying Condition.

The report of the Guggenhelm Explora-

ber 31, 1997, shows the following finan-

stock Smelters Securities (A)

Smelters Securities

"New, however, in the opinion of our engineers, the development and equipment of the Utah Coper company, Nevada Consolidated Copper company, Cumberland-Ely Copper company and Yukon Gold company have progressed so far as to assure the earning of dividends during the year 1908."—Engineering and Mining Journal.

of some law providing for the equitance distribution of the water would probably result in a great improvement of the present conditions.

Fortunately, the residents of the region need not rely entirely on the stream waters to supply their needs. Springs are numerous, and the shallow and deep wells listed in Mr. Lee's report number almost 150. Nearly half of the deep wells are classed as flowing. The loose gravels that form the floor of the valley hold water in immense quantities, so great in places as to be a source of embarrassment. In the town of Beaver the conditions brought about by the behavior of the ground water are serious and are apparently becoming more so year after year. In 1906 swamp areas caused by the midsummerrise of the water rendered impassable country roads and city streets, and mado uninhabitable houses that had been considered safe. That great injury to health is likely to result from such conditions is fully realized by many citizens, and efforts will undoubtedly be made to secure public action in draining the town or otherwise disposing of this water, so superfluous where it is and so urgently needed elsewhere. Mr. Lee suggests that the establishment of a large number of pumping plants tapping this underflow might solve the drainage problem satisfactorily and make it possible to place the water where it can be applied to irrigation. The cheap power required for the economic use of such pumping plants is available in immense quantities in Reaver canyon. With the development of those underground waters and the proper conservation of the surface waters the acreage of cultivable land in Beaver valley might easily be doubled.

COPPER MINES WELL

UP IN THE LIST

MINE PROFITS

MADE THIS YEAR

Metal Selling Agencies Are Becoming Very Lucrative Branch of Trade.

works in the United States to pay dividends aggregating the total of \$11,633,196 is a pretty good indication of the profits that are being made notwithstanding the lower market prices of silver, copper, lead and zinc. These forty-one mines and metallurgical works, according to a careful compilation by the Mining World tion company for the year ended Decem- have paid in dividends since their organ have paid in dividends since their organ-lzation the grand total of \$417.964.321 on an issued capitalization of \$256.759,160. Large as the dividends mentioned above may seem, they do not include the dis-bursements by the Amalgamated Copper-company and other securities holding cor-porations. From January to March this year four securities-holding corporations, having an outstanding capital of \$241,-266.000, declared dividends of \$2,247,001, making the total since their organization \$72,388,661.

making the total since their organization \$72,388,661.

Another source of large revenue from mines is the sale of the products on commission. One metals selling corporation which is identified with the Amalgamated and other large interests by reason of the fact that it markets their copper, declared a dividend of \$275,000 this year, making the total to date \$6,000,000 on a \$5,000,000 capitalization.

Of the thirty-six metal mines that paid making the total to date \$6,000,000 on a \$5,000,000 capitalization.

Of the thirty-six metal mines that paid dividends in the first quarter this year, nine produced copper, and these report a distribution of \$3,622,162. Since their incorporation these nine copper mines have yielded dividends amounting to the large total of \$272,030,676 on an outstanding capitalization of only \$51,275,000. Calumet & Hecla, which on its \$2,500,000 has declared dividends to date of \$106.350,000, out its quarterly payment in 1905 in half (to \$500,000 or 50 per share), behas declared dividends to date of \$400.
\$55,000, cut its quarterly payment in 1908
in half (to \$500,000, or \$5 per share), because the copper market is in an uffisettied condition. Nearly all the other copper mines reduced their regular dividends

Total \$32,897,762

The detail of "other properties and investments" is made up of the following items: Cumberland-Ely Copper company, \$912,808; Esperanza, Ltd. \$425,183; Nevada Consolidated Copper company, \$1.671,859; Nevada Copper company, \$1.671,859; Nevada Northern Ralirosal company, \$4.632,283, Yukon Gold company, \$3,22,106; miscellaneous investments, \$550,020; total, \$17,564,989.

All of the above Items, excepting "miscellaneous investments," are carried at cost. Pacific Gold Dredging company, Atlin Consolidated Mining company, Yukon Consolidated Gold Fields company, Bullion Hydraulic Mining company, and Carboo Gold Mining company, shown in the last annual statement, have all been merged into the Yukon Gold company.

President Daniel Guggenheim says: "We believe the stockholders have every reason to feel gratified with this statement, considering that none of the properties enumerated above, with the exception of Esperanza Ltd., has been upon a dividend-paying basis up to the present time.

"Now, however, in the opinion of our temporarily:

Twenty-six gold, silver and lead mines have declared dividends of \$2,223,168 so far this year, making their grand total since incorporation \$89,418,336 on an issued capitalization of \$91,202,200. The largest individual payer was the Homestake gold mine in the Black Hills of South Dakota; it declared three monthly dividends to the aggregate total of \$327,500, bringing its record to \$16,407,950 on a capitalization that has gradually been increased to \$21,840,000. The Bunker Hill & Sullivan silver-lead mine in the Coeur d'Alene district, Idaho, also a regular monthly dividend payer, has been obliged to reduce its rate, so that for the first three months this year the amount totaled only \$210,000. To date the Bunker Hill & Sullivan mine has yielded dividends of \$9,396,000 on a \$3,000,000 capitalization—an excellent showing. Five gold and silver mines in the newer districts of Nevada came forward this year with dividends of \$350,500, making the total since their organization \$1,210,950 on an issued capitalization of \$4,005,000. The labor troubles at Goldfield have also been responsible for the interruption of dividends in that quarter. Only one quick-silver mine in California has declared a dividend this year amounting to \$30,000, making a total to date of \$1,010,000 on a temporarily:
Twenty-six gold, silver and lead

dends in that quarter. Only one quicksilver mine in California has declared a
dividend this year, amounting to \$50,000,
making a total to date of \$1,010,000 on a
\$500,000 capitalization.

Five metallurgical works are credited
with dividends this year amounting to
\$5,738,566, making their total since organization \$15,505,300 on the outstanding
share-capital of \$213,732,256. To be sure,
the American Smelting and Refining company takes the lead in this group, having
declared this year \$3,250,000 (at the rate
of 2 per cent on the common stock and
32 per cent on the preferred), making the
total to date \$41,831,553. The present
outstanding capital of the "smelting
trust" is \$100,000,000, equally divided in
common and preferred stock. The I inited
States Smelting Refining and Mining
company has declared dividends of \$1,
201,350 this year (being 2 per cent on the
preferred), making a total of \$4,877,941 to
date on the issued capitalization of \$41,
\$46,650. That the surface waters now applied to irrigation in Beaver valley. Utah, might be made to serve a greatly increased acreage of land, with notable benefit to areas already under cultivation, is the opinion of Willis T. Lee of the United States geological survey, whose the United Stales geological survey, whose report on an investigation of the water resources of the valley has just been published by the survey as Water Sup-ply Paper No. 217. In this investigation State, county and Federal governments published by the survey as Water Supply Paper No. 217. In this investigation State, county and Federal governments were equally interested.

Beaver valley occupies the eastern third of Beaver county, in southwestern Utah, about 175 miles south of Sait Lake, and, with its bordering highlands, comprises an area of approximately 1200 square miles, a large part of which is rocky upland or barren desert. The tilled land now includes only the comparatively small areas (estimated at 11.360 acres in all) in the immediate vicinity of the streams—Beaver river, North creek, South creek and Indian creek. These streams derive their waters almost entirely from the heavy precipitation on the lofty peaks of the Tushar mountains, which border the valley on the east. The rate of run-off from the mountains is regulated by the porous character of the rocks—loose volticale tuffs and breccias that absorb water in large quantities—and by the accumulation of snow, whose gradual melting during the spring and carry summer feeds the streams. The conservation of these streams waters, which is of the utmost importance to the development of the agricultural resources of the region, will be greatly aided by the forest reserve that has recently been established in Tushar mountains.

Of the actual quantity of water carried by the streams of Beaver valley little is known. The earliest settlers appropriated all the water they needed, the later ones took what they could get, and all the summer flow has long since been appropriated; but that much of this water is misused cannot be doubted and an effort on the part of the community to bring about the passage and enforcement of some law providing for the equitable distribution of the water would probably result in a great improvement of the present conditions.
